

Question: Job Portal Application

You are tasked with developing a job portal application that allows both employers and job seekers to interact with the system. The system should support the following features:

Job Posting:

- Fields to be captured: Job Title, Company Name, Location, Image Field (Company Logo), Company Description, Job Description, Qualifications, and Deadline.
- Employers can add, update, and delete job postings.

Job Seeker Visibility:

- Job seekers should be able to view job details without seeing the created time and updated time.

Job Seeker Profile:

- Job seekers should have a profile where they can add skills and upload a resume.

Job Table Display:

- A table should display job postings with the following columns: Company Name, Image Field (Company Logo), Location, Qualifications, Deadline, Create Time, Update Time, and Actions.
- Actions should include options for viewing details, applying for the job, and any other relevant actions.

Tasks:

- Implement CRUD operations for job postings.
- Ensure job seekers can view job details without created and updated timestamps.
- Create a job seeker profile with the ability to add skills and upload a resume.
- Design a table that displays relevant job information for job seekers.

Considerations:

- Use appropriate technologies for backend and frontend development.
- Implement security measures to protect user data.
- Ensure a user-friendly interface for both employers and job seekers.

Evaluation Criteria:

- The completeness of CRUD operations.
- Implementation of job seeker visibility requirements.
- Functionality and design of the job seeker profile.
- Effectiveness of the job table display.
